

PETRIHOS LEVER INDEX (PLI)

Fractured Order 2.0

Annotated Bibliography

Macro • National Interest • Escalation / Glasl • Diplomacy • Information

Source documentation for all PLI adjudication tracks: macroeconomic baseline and lever matrix (Sources 1-10); National Interest (11-14); Glasl escalation (15-17); Diplomacy indexing (18-20); and Information SME briefs (21-22). Each source is tagged to the model it grounds.

Statecraft Simulations Group | William & Mary

Ben Petrihos, Senior Fellow

2026

Purpose: Source documentation for all PLI adjudication tracks: (a) the six-year (2026-2031) macroeconomic baseline and lever x indicator matrix (Sources 1-10, tagged Macro); (b) National Interest six-domain tier adjudication (Sources 11-14, tagged National Interest); (c) Glasl escalation staging (Sources 15-17, tagged Escalation / Glasl); (d) Diplomacy indexing taxonomy (Sources 18-20, tagged Diplomacy); and (e) Information SME briefing practice (Sources 21-22, tagged Information).

Selection standard: Institutional forecasters and peer-reviewed or statutory/central-bank research for Macro; National War College / NSS corpus and peer-reviewed interest-intensity literature for National Interest; Glasl's conflict-escalation model and peer-reviewed conflict-management applications for Escalation; U.S. Department of State FAM/FAH materials plus scholarly public-diplomacy literature for Diplomacy; peer-reviewed information-environment literature for Information briefs (no numeric scoring).

Model tags: Each source header ends with the track it grounds, e.g. `(Macro)`, `(National Interest)`.

The five indicators

#	Indicator	Definition used	Primary anchor
1	Real GDP growth	Annual % change, real gross domestic product	IMF Article IV (Mar 2026)
2	Inflation	PCE price index, Q4/Q4 % change	IMF Article IV; Fed SEP
3	Unemployment rate	Annual average, % of labor force	IMF Article IV; CBO
4	Trade volume growth	Goods export + import volume growth, average % (NIPA basis)	IMF Article IV; WTO
5	Fixed investment growth	Private fixed investment, annual % change	IMF Article IV; CBO

Source 1 - IMF, United States 2026 Article IV Consultation (Country Report No. 26/76) `(Macro)`

Citation: International Monetary Fund. United States: 2026 Article IV Consultation - Press Release; Staff Report. IMF Country Report No. 26/76, March 17, 2026.

URL: <https://www.imf.org/-/media/files/publications/cr/2026/english/1usaea2026001.pdf>

What it provides: The single most complete table for our purpose - "Selected Economic Indicators, 2020-31" - with annual projections for every PLI indicator through 2031, exactly matching the six-year game horizon.

Key projections (2026 -> 2031):

- Real GDP growth: 2.5 -> 2.2 -> 2.1 -> 1.9 -> 1.8 -> 1.8
- PCE inflation (Q4/Q4): 2.8 -> 2.0 -> 2.0 -> 2.0 -> 2.0 -> 2.0
- Unemployment rate: 4.3 -> 4.2 -> 4.0 -> 3.9 -> 3.9 -> 3.9
- Goods export volume growth: 0.5 -> 2.3 -> 2.4 -> 1.7 -> 1.8 -> 1.7
- Goods import volume growth: 1.4 -> 4.8 -> 0.3 -> 1.0 -> 1.5 -> 1.3
- Private fixed investment growth: 4.0 -> 3.3 -> 2.1 -> 1.8 -> 1.8 -> 1.8
- Current account balance: -3.8 to -3.6 % of GDP (context, not a scored indicator)

Reliability: IMF Article IV staff projections are produced under a published surveillance framework, reconciled against national accounts (BEA/BLS), and reviewed by the Executive Board. Historical forecast-error ranges are documented by the IMF's own Independent Evaluation Office.

Use in PLI: Primary anchor for all five baseline trend lines. It is the only source with all five indicators on a single consistent basis through 2031.

Source 2 - IMF, World Economic Outlook (April 2026) `(Macro)`

Citation: International Monetary Fund. World Economic Outlook: Global Economy in the Shadow of War. April 14, 2026.

URL: <https://www.imf.org/-/media/files/publications/weo/2026/april/english/text.pdf>

What it provides: Global context and cross-checks: world output growth 3.1% (2026) and 3.2% (2027); US growth 2.3% (2026) and 2.1% (2027); US public debt path to ~143% of GDP by 2031; trade-policy assumption that tariff measures in force at end-2025 are permanent.

Reliability: The WEO is the most widely used institutional forecast in existence; its database publishes vintages so forecast revisions are fully traceable.

Use in PLI: Corroborates the Article IV GDP path (WEO 2.3% vs Article IV 2.5% for 2026 - differences reflect Q4/Q4 vs annual-average bases). Supplies the standing trade-policy assumption that the baseline already embeds 2025-era tariffs - important so adjudicators do not double-count existing tariffs as a new action.

Source 3 - Congressional Budget Office, The Budget and Economic Outlook: 2026 to 2036 (February 2026) `(Macro)`

Citation: Congressional Budget Office. The Budget and Economic Outlook: 2026 to 2036. February 11, 2026.

URL: <https://www.crfb.org/papers/cbos-february-2026-budget-and-economic-outlook> (summary); CBO publication.

What it provides: A ten-year legislated-policy baseline: real GDP growth 2.2% (2026) slowing to a 1.8% annual average; PCE inflation 2.7% (2026) returning to 2.0% by 2030 (slower than the IMF's 2027); unemployment peaking at 4.6% (2026) and declining to 4.2% by 2032; CPI inflation 2.9% (2026), 2.3% ten-year average.

Reliability: CBO is statutorily nonpartisan; methods and forecast-error evaluations are published. Its baseline is current-law, which makes it the correct reference for Implementation scoring questions about what enacted legislation already covers.

Use in PLI: (1) Corroborates GDP and unemployment direction; (2) brackets the inflation-normalization window (IMF 2027 vs CBO 2030 - the baseline chart shows the IMF path with the CBO date noted as the slow bound); (3) serves as the reference document for "existing legislation" in the Implementation precedent test (e.g., what OBBBA already authorizes).

Source 4 - Federal Reserve, Summary of Economic Projections (December 2025) `(Macro)`

Citation: Board of Governors of the Federal Reserve System. Summary of Economic Projections. December 10, 2025.

URL: <https://www.federalreserve.gov/monetarypolicy/fomcprojtabl20251210.htm>

What it provides: FOMC median projections: real GDP growth 2.3 (2026), 2.0 (2027), 1.9 (2028), 1.8 longer run; unemployment 4.4 / 4.2 / 4.2, 4.2 longer run; PCE inflation 2.4 / 2.1 / 2.0, 2.0 longer run.

Reliability: The SEP is the policy-setting institution's own outlook; it defines the "longer-run" convergence values that anchor the flat tail of our six-year trend lines (growth ~1.8, unemployment ~4, inflation = 2.0).

Use in PLI: Confirms the convergence values for years 4-6 of every trend line and supplies the monetary-policy assumption (policy rate drifting toward ~3%) that underlies the L5 lever's neutral baseline.

Source 5 - World Trade Organization, Global Trade Outlook and Statistics (March 2026) `(Macro)`

Citation: World Trade Organization. Global Trade Outlook and Statistics. March 19, 2026.

URL: https://www.wto.org/english/res_e/booksp_e/gtos0326_e.pdf

What it provides: World merchandise trade volume growth of 4.6% (2025), slowing to 1.9% (2026) and recovering to 2.6% (2027); services trade 4.8% -> 5.1%; scenario band of 1.4%-2.4% for 2026 depending on energy-shock persistence and AI-related goods demand.

Reliability: The WTO trade model is the standard institutional reference for trade volumes; the report publishes explicit upside/downside scenarios, which we adopt as the uncertainty band on the trade indicator.

Use in PLI: Primary corroboration for the trade volume growth trend line and the source of its ± 0.5 pp scenario band. Its finding that 2025 strength reflected tariff front-running (not underlying demand) justifies the subdued 2026 baseline that L1/L2 actions are scored against.

Source 6 - OECD, Economic Outlook Volume 2026 Issue 1 (June 2026) `(Macro)`

Citation: Organisation for Economic Co-operation and Development. OECD Economic Outlook, Volume 2026 Issue 1. June 2026.

URL:

https://www.oecd.org/content/dam/oecd/en/publications/reports/2026/06/oecd-economic-outlook-volume-2026-issu-e-1_8be0dba6/2d1956f0-en.pdf

What it provides: US real GDP growth 2.0% (2026), 1.8% (2027); US headline inflation 4.2% (2026) under the energy-shock scenario, falling to 1.6% (2027); a two-scenario structure ("time-limited" vs "prolonged" disruption) with GDP as low as 1.4% (2026) / 0.6% (2027) in the prolonged case.

Reliability: OECD projections are produced with a documented global model; the June 2026 edition is the most recent of the six sources and the only one fully incorporating the mid-2026 energy shock.

Use in PLI: Defines the adverse-scenario band on the inflation and GDP trend lines. Where White Cell rules that the game world includes a persistent energy shock, the OECD prolonged-disruption path replaces the IMF baseline for inflation in that scenario year.

Part B - Sources grounding the directionality matrix and Implementation modulation

The four sources below anchor the lever x indicator directionality matrix (which way each lever pushes each indicator, how hard, and with what onset) and the Implementation modulation table (why weakly implemented actions deliver diluted, delayed effects). They are findings about direction, relative magnitude, and timing - exactly the layer PLI adjudicates - not point forecasts.

Source 7 - Amiti, Redding & Weinstein, "The Impact of the 2018 Tariffs on Prices and Welfare" (2019) `(Macro)`

Citation: Amiti, Mary, Stephen J. Redding, and David E. Weinstein. "The Impact of the 2018 Tariffs on Prices and Welfare." Journal of Economic Perspectives 33(4), Fall 2019, pp. 187-210. DOI: 10.1257/jep.33.4.187.

What it provides: The benchmark empirical study of the 2018 United States tariff waves. Finds complete pass-through of the tariffs into domestic prices of imported goods, with the full incidence falling on domestic consumers and importers; an aggregate United States real-income loss of roughly \$1.4 billion per month by end-2018; roughly \$165 billion per year of trade redirected to avoid the tariffs; and a ~1 percentage point rise in average United States manufacturing prices from combined input/output tariff effects.

Reliability: Published in a peer-reviewed American Economic Association journal; among the most-cited empirical

papers on modern tariff policy (700+ citations); findings replicated in the parallel literature (Fajgelbaum et al. 2020, Quarterly Journal of Economics; Cavallo et al. 2021).

Use in PLI: Grounds the L1 Trade & Customs matrix row: inflation +M (complete pass-through into domestic prices), trade -S (large redirection and volume suppression), GDP -s (real-income loss), investment -s, and short quarterly onset / fast ramp (`onset\_quarters` 0-1, `ramp\_in\_quarters` ? 2 - price effects appeared within months).

Source 8 - Crosignani, Han, Macchiavelli & Silva, "Securing Technological Leadership? The Cost of Export Controls on Firms" (2024, rev. 2025) `(Macro)`

Citation: Crosignani, Matteo, Lina Han, Marco Macchiavelli, and André F. Silva. "Securing Technological Leadership? The Cost of Export Controls on Firms." Federal Reserve Bank of New York Staff Reports, No. 1096, April 2024, revised February 2025. DOI: 10.59576/sr.1096.

What it provides: The leading empirical study of United States export controls on China-linked supply chains. Finds that export controls trigger a broad-based, involuntary decoupling: affected United States suppliers terminate relations with both targeted and non-targeted Chinese customers (terminations up 50-75%), form 60-68% fewer new relationships in targeted countries, and show no evidence of reshoring or friend-shoring within three years. Affected suppliers lose roughly \$130 billion in market capitalization and experience reduced profitability, employment, and bank lending.

Reliability: Federal Reserve Bank of New York staff research with published data and methodology; authors are Federal Reserve research economists.

Use in PLI: Grounds the L2 Export Controls matrix row: trade -M (broad decoupling), investment -s and GDP -tr (costs borne by the acting economy's own firms), onset ~2-4 quarters (terminations prompt; macro/reshoring lag). The "no reshoring within three years" finding supports scoring resilience claims conservatively and keeps friend-shoring ramps slow.

Source 9 - Felbermayr, Kirilakha, Syropoulos, Yalcin & Yotov, "The Global Sanctions Data Base" (2020) `(Macro)`

Citation: Felbermayr, Gabriel, Aleksandra Kirilakha, Constantinos Syropoulos, Erdal Yalcin, and Yoto V. Yotov. "The Global Sanctions Data Base." European Economic Review 129, 2020, 103561. DOI: 10.1016/j.euroecorev.2020.103561.

What it provides: The most comprehensive dataset of economic sanctions (1950-2016; later releases extend to 2022), with structural-gravity estimates of their trade effects. Core finding: trade sanctions have a negative but heterogeneous effect on trade - most pronounced for complete bilateral sanctions, followed by complete export sanctions, while partial sanctions show smaller and sometimes insignificant aggregate effects. Documents the shift toward financial (rather than trade) sanctions and declining success rates since 1995.

Reliability: Peer-reviewed (European Economic Review); the dataset is the standard reference in the quantitative sanctions literature and is publicly maintained and updated.

Use in PLI: Twofold. (1) Grounds the L4 Financial Sanctions matrix row: trade -M, with small price and output costs to the acting economy. (2) Grounds the Implementation magnitude-downgrade ladder and slower/weaker quarterly weights under partial execution: complete sanctions bite hardest; partial ones do not deliver instant full bite.

Source 10 - Congressional Budget Office, federal investment analyses (2016, 2021) `(Macro)`

Citation: Congressional Budget Office. The Macroeconomic and Budgetary Effects of Federal Investment. June 2016 (Publication 51628). - and - Effects of Physical Infrastructure Spending on the Economy and the Budget Under Two Illustrative Scenarios. August 2021 (Publication 57407). See also CBO, "Estimating the Long-Term Effects of Federal R&D Spending" (2018, Publication 54089).

What it provides: CBO's standing framework for how public investment reaches the economy. Key findings: federal investment raises private-sector productivity and output only gradually; of an illustrative \$500 billion infrastructure authorization, only about \$12 billion is actually spent in the first year (roughly \$33 billion by year two, 96% only by 2046); macroeconomic effects of applied research spending begin only after roughly ten years; and the net GDP effect depends on financing (borrowing-financed investment yields roughly half the ten-year GDP gain of offset-financed investment).

Reliability: CBO is the statutorily nonpartisan scoring agency of the United States Congress; its methods and forecast-error evaluations are published, and these reports are the reference framework used in actual legislative scoring.

Use in PLI: Grounds three design choices. (1) The L7 Industrial Policy matrix row: strongest positive investment impulse (+S) but long `onset\_quarters` (~8) and multi-year `ramp\_in\_quarters` (~12 for GDP). (2) The L6 Development Finance long onset/ramp. (3) The Implementation onset-delay column in quarters (+4 / +8): the documented multi-year gap between authorization, outlay, and macroeconomic effect - and against CBO's ten-year horizon for research spending, the game's delays remain conservative.

Quarterly adjudication grid and month anchors

Codebook version: `trial-2026-07-13-quarterly`.

PLI adjudicates on a quarterly grid (`2026Q1` ... `2032Q4`), not annual bricks. FO 2.0 worksheets carry a required `submission\_month` (`YYYY-MM`); the engine maps month -> calendar quarter and measures onset, Implementation delay, ramp-in, plateau, and decay in quarters:

`start\_quarter = submission\_quarter + onset\_quarters + impl\_delay\_quarters`

`delta[q] = sign x magnitude x weight(q)` with `weight ? [0,1]` from ramp -> plateau -> decay (bib-cited profile fields on each leverindicator cell).

Timing behavior	Bib anchor	How it enters PLI
Coercive trade/price effects within months	Source 7	L1: short onset, fast ramp
Export-control decoupling prompt; reshoring lag	Source 8	L2: onset ~2-4Q; slow resilience claims
Sanctions completeness -> magnitude	Source 9	L4 + Implementation downgrades; partial -> weaker weights
Public investment gradual outlay/productivity	Source 10	L6/L7: long onset + multi-year ramp; Impl delay adds quarters
Baseline path / horizon	Sources 1-6	Annual institutional rates expanded by within-year hold onto the quarterly grid through 2032Q4

Discretization rule (Sources 1-6): Institutions publish annual or Q4/Q4 rates. The quarterly series holds each year's institutional rate constant across Q1-Q4 of that year. This is an adjudication discretization for month anchors and path shape - not a claim of higher-frequency institutional point forecasts. Fed SEP inflation already frames Q4/Q4; annual identity is preserved when aggregating quarters for display if needed.

Multi-action stacking (game rule, not a bib lag): How multiple actions combine on the same indicator-quarter (`uncapped` default, or `same\_quarter` / `per\_move` clamps at $\pm S$) is a FO 2.0 display/adjudication policy in the codebook and engine. It does not introduce a new lag length and does not require a Sources 7-10 timing update.

Rule: no new lag length without a bibliography "Use in PLI" update and a codebook changelog row.

Synthesis - the adopted baseline (2026-2031, held through 2032Q4)

Primary anchor: IMF Article IV (Source 1). Convergence tail checked against Fed SEP (Source 4). Trade corroborated by WTO (Source 5). Inflation normalization window bracketed by CBO (slow bound, Source 3) and OECD (shock bound, Source 6).

Indicator	2026	2027	2028	2029	2030	2031	Directionality summary
Real GDP growth (%)	2.5	2.2	2.1	1.9	1.8	1.8	Gradual glide to ~1.8% potential
PCE inflation (Q4/Q4, %)	2.8	2.0	2.0	2.0	2.0	2.0	Normalizes to target by 2027 (CBO slow bound: 2030)
Unemployment rate (%)	4.3	4.2	4.0	3.9	3.9	3.9	Slight improvement, then flat near 4%
Trade volume growth (goods, %)	1.0	3.6	1.4	1.4	1.7	1.5	Subdued with 2027 rebound; ± 0.5 pp WTO band
Fixed investment growth (private, %)	4.0	3.3	2.1	1.8	1.8	1.8	Strong AI-driven start, normalizing

Known disagreements (flagged for SME review):

- Inflation normalization date - IMF/Fed say 2027; CBO says 2030 (tariff persistence); OECD says a 2026 spike to 4.2% then undershoot to 1.6%. The trend line uses the IMF path; the chart carries a shaded band spanning CBO and OECD bounds.
- 2026 GDP - range of 2.0 (OECD) to 2.5 (IMF Article IV annual). Direction is identical (deceleration toward 1.8); magnitude differences do not affect directionality adjudication.
- Trade 2027 rebound - IMF import-volume rebound (4.8%) is larger than WTO world figure (2.6%); both agree on direction.

Why directionality, not point estimates: Across these six institutions, six-year point forecasts differ by up to 1.4 pp on the same indicator in the same year, but direction and shape (decelerating growth, normalizing inflation, flat unemployment, subdued trade, front-loaded investment) are unanimous. PLI therefore adjudicates against direction and shape - the empirically defensible layer of the forecast.

Part C - National Interest `(National Interest)`

Source 11 - National War College (NDU), A National Security Strategy Primer (Vital / Important / Peripheral) `(National Interest)`

Citation: Heffington, Steven, Adam Oler, and David Tretler, eds. A National Security Strategy Primer. Washington, DC: National War College, National Defense University Press. Public editions: [NWC Primer (NDU)](https://nwc.ndu.edu/Portals/71/Documents/Publications/NWC-Primer-FINAL_for%20Web.pdf) and [2021 update](<https://nwc.ndu.edu/Portals/71/Images/Publications/NWC%20NSS%20Primer%202021.pdf>). Local working copy used in the SSG NI methodology package: `codebook/evidence/ni/2025 NWC NSS Primer copy.pdf` (cover identifies National War College / National Defense University - not the Naval War College).

What it provides: Practitioner adjudication grammar distinguishing vital, important/major, and peripheral interests - including the vital-interest threshold that a state would bear nearly any cost and risk (including significant war risk) to protect. Also supplies the Capability x Will x Vulnerability threat cross-check used when any NI domain moves negative.

Reliability: National War College (NDU) teaching primer used to train senior officers and civilian national-security professionals in NSS interpretation; not a presidential NSS text, but the standard practitioner overlay when NSS documents omit systematic tier labels.

Use in PLI: Supplies the tier delta codes (+2/?2 vital, +1/?1 major, 0 peripheral) and threat cross-check grammar in the National Interest track (`04\_NATIONAL\_INTEREST\_CODEBOOK.md`).

Source 12 - SSG NSS Interest Matrix and U.S. National Interest Assessment Methodology (2026) `(National Interest)`

Citation: Statecraft Simulations Group. U.S. National Interest Assessment Methodology v1.0 (July 2026); NSS Interest Matrix (1993-2025 corpus mapping). Local evidence: `codebook/evidence/ni/`.

What it provides: Six bipartisan interest domains (NI-1-NI-6) distilled from NSS language; orientation priors (Pressure / Stabilization / Reframing); threat cross-check formula; PRC framing evolution by NSS era.

Reliability: Game-agnostic research layer grounded in the public NSS corpus and National War College tier grammar; matrix provides era-by-era citation rows for SME traceability.

Use in PLI: Authoritative domain definitions and orientation priors for the NI adjudication engine.

Source 13 - Nuechterlein, "National Interests and Foreign Policy: A Conceptual Framework for Analysis and Decision-Making" (1976) `(National Interest)`

Citation: Nuechterlein, Donald E. "National Interests and Foreign Policy: A Conceptual Framework for Analysis and Decision-Making." *British Journal of International Studies* 2(3), 1976, pp. 246-266. DOI: 10.1017/S0260210500115286.

What it provides: Classic peer-reviewed framework separating interest intensity (survival / vital / major / peripheral) from interest type, enabling structured comparison of stakes rather than treating "national interest" as a single scalar.

Reliability: Foundational peer-reviewed contribution in international studies; widely cited in subsequent interest-assessment and strategy curricula.

Use in PLI: Grounds the decision to adjudicate a six-domain intensity vector rather than FO 1.0's single US/PRC scalar, and supports sparing use of vital-level (± 2) deltas.

Source 14 - Brooks, Ikenberry & Wohlforth, "Don't Come Home, America: The Case against Retrenchment" (2012/2013) `(National Interest)`

Citation: Brooks, Stephen G., G. John Ikenberry, and William C. Wohlforth. "Don't Come Home, America: The Case against Retrenchment." *International Security* 37(3), Winter 2012/13, pp. 7-51. DOI: 10.1162/ISEC_a_00107. (MIT Press / Belfer Center ecosystem.)

What it provides: Peer-reviewed argument linking alliance credibility, forward posture, and economic/order-maintenance interests - showing how partner hedging and order erosion can damage U.S. interests even when short-run material costs look manageable.

Reliability: Leading security-studies journal (*International Security*); MIT Press distribution; heavily cited in alliance and grand-strategy debates.

Use in PLI: Grounds NI-3 (Alliance / Partner Credibility) and the cross-domain alert that high escalation with negative NI-3 can harm U.S. interests even when NI-2 looks positive.

Part D - Escalation / Glasl `(Escalation / Glasl)`

Source 15 - Glasl, Confronting Conflict / conflict-escalation model (stages 1-9) `(Escalation / Glasl)`

Citation: Glasl, Friedrich. *Confronting Conflict: A First-Aid Kit for Handling Conflict*. Stroud: Hawthorn Press, 1999 (English ed.; German originals earlier). Model also summarized in Glasl, "Konfliktmanagement" practitioner literature.

What it provides: The nine-stage conflict-escalation ladder from hardening of positions through loss-of-face, threats/ultimatums, and limited destructive blows to together-into-the-abyss dynamics.

Reliability: Standard reference in organizational and international conflict-management practice; FO 1.0 Interim Report used stages 4-7 as the game's operating range.

Use in PLI: Primary stage definitions for the Escalation track (`05\_GLASL\_ESCALATION\_CODEBOOK.md`).

Source 16 - Glasl, "Konfliktmanagement" stage operationalization in peer conflict-resolution literature `(Escalation / Glasl)`

Citation: Glasl, Friedrich. *Konfliktmanagement: Ein Handbuch für Führungskräfte, Beraterinnen und Berater*. Bern: Haupt Verlag (multiple editions; English operational summaries in conflict-resolution curricula). Complementary peer-reviewed treatment of escalation dynamics: Pruitt, Dean G., and Sung Hee Kim. *Social Conflict: Escalation, Stalemate, and Settlement*. 3rd ed. New York: McGraw-Hill, 2004.

What it provides: Stage-by-stage behavioral thresholds that map Glasl's ladder onto observable moves - coalition/reputation competition, public loss of face, threats/ultimatums, and limited destructive blows - plus the broader escalation/stalemate/settlement grammar used in academic conflict studies.

Reliability: Glasl's handbook is the primary practitioner source for the nine-stage model; Pruitt & Kim is a standard peer-reviewed/academic conflict-resolution text that situates escalation as a structured process rather than a vibe judgment.

Use in PLI: Clarifies stage-matching criteria adjudicators cite when proposing a per-action ?, alongside Source 15's primary Glasl definitions.

Source 17 - Fractured Order Interim Report V4.10.2 - Escalation operating notes `(Escalation / Glasl)`

Citation: Statecraft Simulations Group. *Fractured Order Interim Report V4.10.2 - National Interests and Escalation* section.

What it provides: Empirical game notes: baseline Escalation stage 4; Stage 4 = coalition/reputation competition; Stage 5 = public loss of face; Stage 6 = strategic threats/ultimatums; Stage 7 = limited destructive blows against vital capabilities; escalation and national interest related but not identical.

Reliability: After-action adjudication record from FO 1.0; not peer-reviewed, but the calibration target for FO 2.0 Glasl application.

Use in PLI: Sets default session start stage (4) and operating-range notes; does not replace Glasl primary definitions.

Part E - Diplomacy `(Diplomacy)`

Source 18 - U.S. Department of State Foreign Affairs Manual / Handbook (public diplomacy, American Spaces, digital engagement) `(Diplomacy)`

Citation: U.S. Department of State. Foreign Affairs Manual / Foreign Affairs Handbook, including 10 FAH-1 H-020 (Public Diplomacy at Posts Abroad); 10 FAM 380 (American Spaces); 10 FAH-1 H-010 / H-060 (American Spaces management; Social Media and Digital Engagement); 10 FAM 180 (Official Communication Using Social Media).

What it provides: Codified Department definitions of public diplomacy, digital engagement, American Spaces / platform-based engagement, and related tools.

Reliability: Official U.S. foreign-affairs procedural doctrine (FAM/FAH).

Use in PLI: Grounds diplomatic subcategories in the Diplomacy Index codebook. The coercive-to-cooperative band ordering (Pressure -> Positioning -> Relationship-Building) remains an analytic synthesis for the game, not an official State taxonomy.

Source 19 - U.S. Department of State diplomacy education materials ("tools of diplomacy") `(Diplomacy)`

Citation: U.S. Department of State. "What are the tools of diplomacy?" and related student/diplomacy-education guides on treaties, negotiation, communications, agreements, and exchange.

What it provides: Official educational framing of bilateral and multilateral diplomatic tools.

Reliability: Official State Department public education materials.

Use in PLI: Grounds Bilateral Diplomacy and Multilateral / Institutional Diplomacy categories.

Source 20 - Nye, "Public Diplomacy and Soft Power" (2008) `(Diplomacy)`

Citation: Nye, Joseph S., Jr. "Public Diplomacy and Soft Power." The ANNALS of the American Academy of Political and Social Science 616(1), 2008, pp. 94-109. DOI: 10.1177/0002716207311699. (Harvard Kennedy School / soft-power research lineage.)

What it provides: Peer-reviewed framing of public diplomacy as attraction and narrative contestation distinct from hard coercive instruments - supporting Relationship-Building and public-diplomacy subcategories as analytically separate from Pressure-band signaling.

Reliability: Peer-reviewed; foundational soft-power / public-diplomacy literature.

Use in PLI: Supports treating Relationship-Building bands as cooperative/attraction-oriented rather than merely "weak Pressure."

Part F - Information `(Information)`

Source 21 - Lin & Kerr, "On Cyber-Enabled Information Warfare and Information Operations" (2017) `(Information)`

Citation: Lin, Herbert, and Jackie Kerr. "On Cyber-Enabled Information Warfare and Information Operations." In Understanding Cyber Conflict: 14 Analogies, edited by George Perkovich and Ariel E. Levite, 223-238. Washington, DC: Georgetown University Press, 2017. (Stanford CISAC / Carnegie Endowment lineage.)

What it provides: Peer-reviewed chapter framing information operations as contests over audiences, credibility, and narrative effects - including second- and third-order political consequences - without collapsing IO assessment into a single numeric score.

Reliability: Georgetown University Press edited volume; authors affiliated with Stanford CISAC; widely assigned in

cyber/IO professional curricula.

Use in PLI: Shapes the unscored Information brief structure (audiences, narratives, second-order effects, SME questions) in `07\_INFORMATION\_BRIEF\_SPEC.md`.

Source 22 - Fractured Order / VerbaAI HARE practice note (operational context) **`(Information)`**

Citation: Statecraft Simulations Group. Fractured Order Interim Report V4.10.2 - VerbaAI / HARE appendix notes on modeling civilian sentiment and second-/third-order information effects.

What it provides: Operational precedent that White Cell benefited from structured information-environment analysis supporting (not replacing) SME judgment.

Reliability: Exercise after-action note; not a peer-reviewed scoring model.

Use in PLI: Confirms Information remains an explanatory SME brief with editable text output - no numeric adjudication.
